

The “Alchemy” of Composting:

Demystifying and Simplifying Composting

Brian Schlaefli
Cowlitz County Master Gardeners
October 4, 2022

Composting is a bit like Alchemy...

Alchemy: any seemingly magical process of transforming or combining common substances, usually of little value, into a substance of great value. (Lead \longrightarrow gold)

Composting: an understood and natural process by which ordinary kitchen and yard waste materials are combined and allowed to decompose into a rich soil amendment. (Yard & Kitchen waste \longrightarrow “black gold”)

COMPOSTING PROCESS

10/8/2012

Wirajasa Teknik Industri

3

Composting might seem “magical” or mysterious. Or, complex and daunting. But, the science is understood. And, the practice can be relatively simple.

The scope of this presentation will not focus much on technical stuff... Rather, my aim is to simplify and demystify it so you will go out and “just do it!”.. .

3

Composting

Topics covered:

- Introduction
- Managing the Decay Process
- Raw Materials
- Other Factors Affecting the Composting Process
- Health and Safety Concerns
- How to Make Compost
- Slow Composting
- Fast Composting
- Troubleshooting
- Using Compost
- Amending Soil
- Mulching
- Vermicomposting
- Supplies for Vermicomposting
- Worm Bin Management
- Harvesting the Vermicompost
- Summary

Learning Objectives

- Realize the importance of composting for improving garden soils as well as for reducing the amount of waste in landfills or other waste treatment facilities
- Understand the biological principles of the composting process
- Understand effective methods and suitable materials for successful composting

By

Craig Cogger, Associate Soil Scientist, WSU Puyallup Research & Extension Center
Dan M. Sullivan, Extension Soil Scientist, Oregon State University, Corvallis
Jim Kropf, WSU Extension Western District Director, Puyallup

Composting: turning kitchen and yard waste into a mulch and a soil amendment for the home gardener

"Alchemy"

Hot composting vs. Cold Composting
(Active vs. Passive)
I will cover hot composting

Composting:

Why?

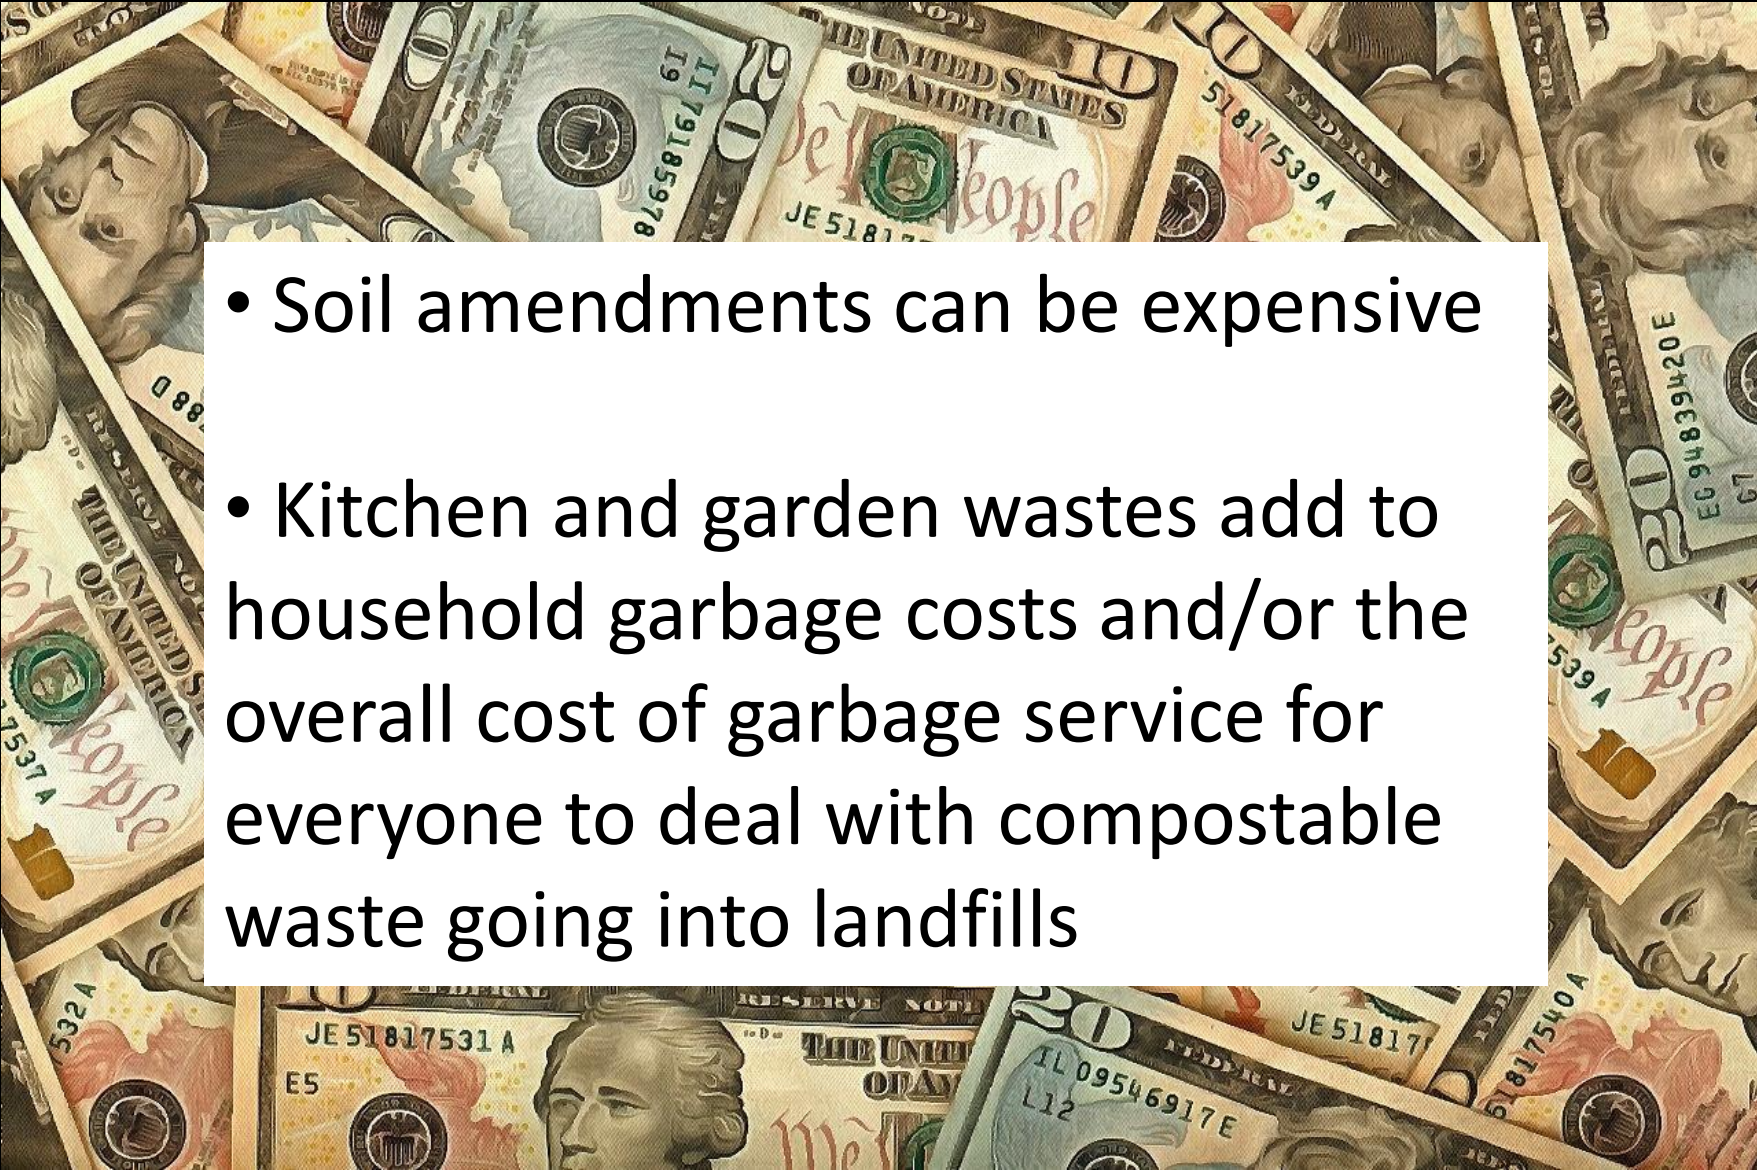

What?

How?

Why bother to compost?

Composting – why?: Saves \$

- 
- The background of the slide is a collage of various US dollar bills, including \$20 and \$100 bills, scattered and overlapping. The bills are slightly tilted and show different parts of the currency, such as the portraits of George Washington and Benjamin Franklin, and the text 'THE UNITED STATES OF AMERICA' and 'FEDERAL RESERVE NOTE'.
- Soil amendments can be expensive
 - Kitchen and garden wastes add to household garbage costs and/or the overall cost of garbage service for everyone to deal with compostable waste going into landfills

Composting – why?: Environmentally Friendly

- Reduces the need for chemical fertilizers.
- Reduces methane gas emissions from landfills and lowers your “carbon footprint”.
- Keeps compostable waste out of landfills.

Composting – why?: Saves on watering

- For each percent of organic matter added to a cubic foot of soil, roughly 1.5 quarts of plant-available water can be retained in that soil.
- Using compost as a top mulch reduces surface evaporation of water

Composting – why?:

Adds Value to Your Garbage (“Alchemy!”)

- Yard waste and kitchen waste can comprise 20% or more of household garbage.
- Composting produces valuable organic matter for your soil from waste that otherwise would go to landfills or into burn piles.

Composting – why?: Helps to grow an amazing garden and yummy veggies!

➤ What can be composted?

What can be composted?

“Green” (higher N)

“Brown” (higher C)

“Balanced”

Grass clippings

Wood chips

Ground up tree and shrub trimmings (leaves+twigs/branches)

Dairy, chicken, or rabbit manure

Sawdust

Horse manure mixed with bedding

Fruit and vegetable waste

Grass hay

Deciduous leaves

Garden trimmings

Wheat straw

Legume hay (pea, vetch, etc.)

Coffee grounds; tea leaves

Corn stalks

Shredded newspaper

What can be composted?

Manures: Rule of Thumb

NO!	<i>Yes!</i>
	
Predator species	Prey species

What can be composted?

Tomato plants

Mowed leaves

Dahlias, etc.

Mulched leaves

Leaves
(before mower
mulching)

Grass

**Kitchen scraps
(don't forget!)**

HERE'S HOW IT WORKS

Much of coffee's acidity is removed in the brewing process, leaving behind a green material that promotes plant growth, repels ants and slugs, and entices earthworms.

Coffee grounds have an average pH of 6.9, a carbon-nitrogen ratio of 20:1, and can be added directly to your garden as a side dressing for nitrogen-loving plants (test with a small amount first).

NBP14-20790

GROUNDS
FOR YOUR
GARDEN

OR ADD TO COMPOST

Combine with "brown" materials for enriched compost. Experts recommend up to 20% coffee grounds in compost pile.

"Alchemy!"

Free coffee grounds from Starbucks not going to the landfill

What NOT to compost?

What not to compost...

Can create odor or attracts pests

Dairy products

Bones and scraps from meat or fish

Fats, lard, oils

Might survive composting process

Diseased or insect-infested plants

Certain weed seeds and certain weed roots or stems (cold composting)

Might contain harmful agents

Pet dog or cat waste; including soiled cat litter

Yard trimmings treated with chemical pesticides (might persist)

Bracken fern*

➤ How to compost?

Compost: A Three-legged Stool

How to compost?... first, some basics

(hopefully not too technical)!

Air (oxygen)

Compost: A Three-legged Stool

The microorganisms that do the work need to “breathe” ... O_2 to live

Water

Compost: A Three-legged Stool

They also need water to survive, but not too much or too little.

- Materials should be damp and not soaking wet.
- Materials should feel like a damp sponge but not able to squeeze water out.

Food

Compost: A Three-legged Stool

Remember to keep the “little guys” fed, but give them a proper diet!

Your compost pile will thrive with a balanced diet

Your pile will struggle if diet not balanced.

C:N ratio (a.k.a. brown : green)

Compost: A Three-legged Stool

The ideal
C : N ratio
(carbon to nitrogen) is
30:1

Material	C:N ratio
Wood chips	641:1
Corrugated cardboard	563:1
Sawdust	500:1
Rotted sawdust	208:1
Newspaper	170:1
Wheat straw	128:1
Dried leaves	70:1
Corn stalks	60:1
Horse manure with litter	60:1
Pine needles	60:1 to 110:1
Peat Moss	58:1
Timothy hay	58:1
Oat straw	48:1
Fresh leaves	40:1
Hay	40:1
Horse manure	30:1
Red clover	28:1
Oak leaves	26:1
Coffee grounds	20:1
Alfalfa pellets	20:1
Cattle manure	19:1
Vegetable produce	19:1
Alfalfa hay	18:1
Composted dry chicken manure	15:1
Fresh grass clippings	17:1
Cottonseed meal	7:1
Soybean meal	6:1
Blood meal	4:1
Urine	0.6:1

But, how do I compost?

(I like to keep it a bit more simple)

Basic Compost Recipe

One part green stuff

Four parts brown stuff

Air and water as desired

1 + 4 = COMPOST

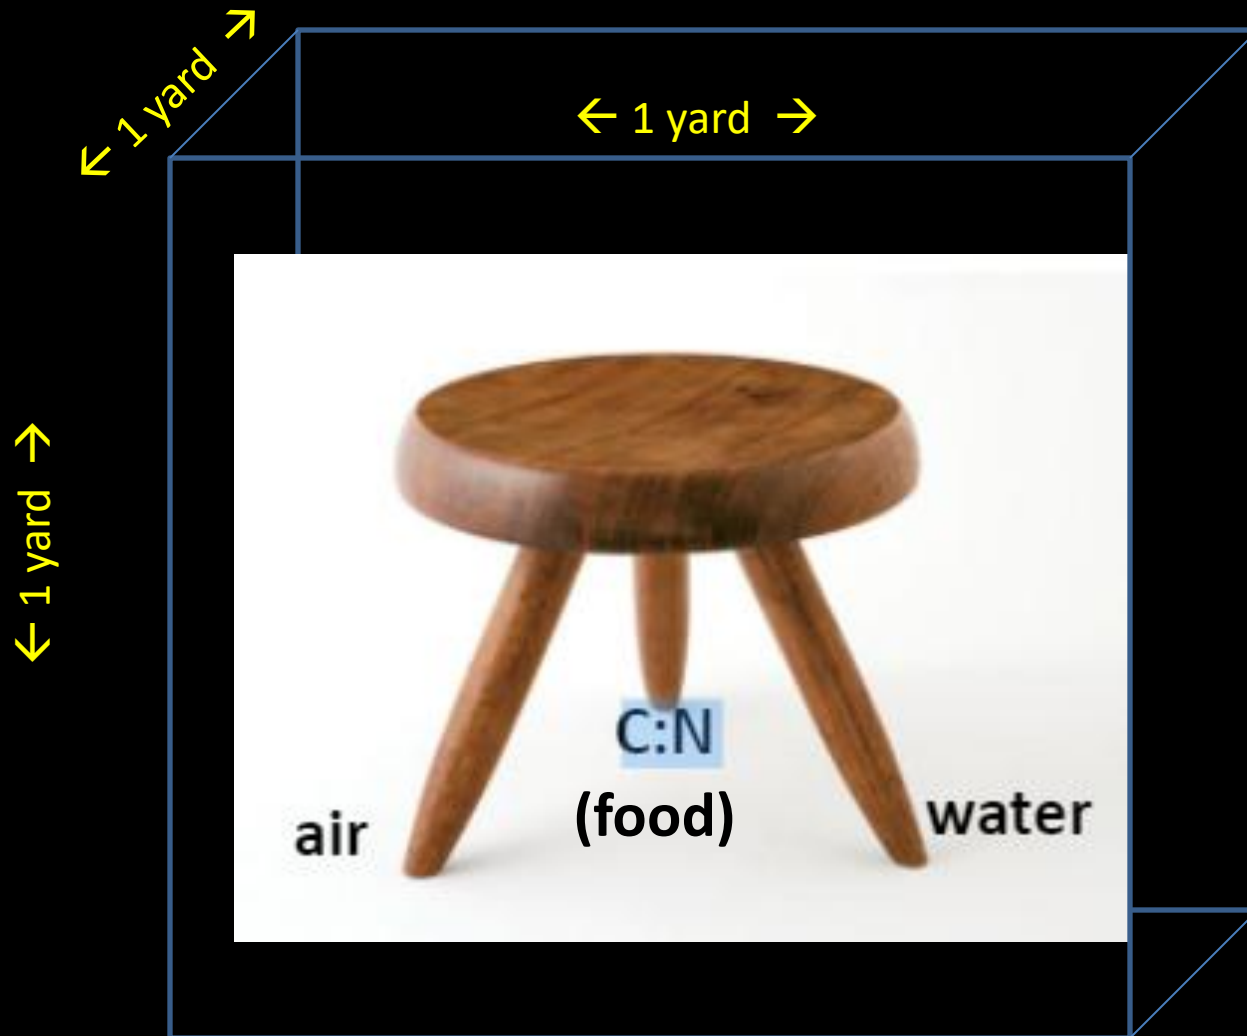

Brrrr....

The right “habitat” is important for effective, hot composting.

All 3 of these factors might be in place, but without suitable “habitat” for hot composting to occur, it'll be a struggle.

1 cubic yard

Ideal hot composting "habitat" is 1 yd³ mounded or contained

How to compost? (cont'd)

Compost bins make managing and containing compost easier...

Compost bins... quite an assortment:

A few examples.
These contain the
materials and aid in
creating "critical mass"
(habitat)

Compost bins... quite an assortment:

My choice...

**It works well, and, it was free
using materials I had on hand**

- 7 pallets
- 2 pieces of plywood
- Hinges
- Scavenged Cinder blocks

Compost bins v3.0 and v3.1

(It's been an evolutionary process)

TOOLS:

It's your choice...
but, here's what works for me

Thermometer!!!

Hose and nozzle

Rake

Leaf blower

Pitch fork

Shovel

Tools cont'd: wheelbarrow

TRUPER

A photograph of a wooden frame structure used for sifting compost. The frame is made of weathered wood and has a fine wire mesh screen attached to its sides. Inside the frame, there are several concrete blocks stacked together. The structure is placed on a ground covered with mulch and some small plants. The text is overlaid on the lower part of the image.

**Optional:
½ inch hardware cloth screen
(to sift finer compost for top mulch)**

Optional:

**½ inch hardware cloth screen
(to sift finer compost for top
mulching)**

**Tools cont'd:
Mulching lawnmower
with/without catcher**

BEFORE

AFTER

**Elapsed time: 10
minutes**

Results of mowing leaves with a catcher

**Before
mulching**

After "mulching"
(no mower bag)

Tomato plants

Mowed leaves

Dahlias, etc.

Mulched leaves

Grass

Leaves
(before mower
mulching)

How to compost? (get ready and just do it!)

Basic Compost Recipe

One part green stuff

Four parts brown stuff

Air and water as desired

1 + 4 = COMPOST

1st day... Wednesday 3:40pm
55 degrees F

2nd day... Thursday 1:50pm
84 degrees F

4th day... Saturday 10:20am
132 degrees F

8th day... Wednesday 10:15am
119 degrees F

8th day... Wednesday 10:15am
119 degrees F

A photograph of a wooden compost bin. The bin is constructed from weathered wooden planks and is filled with a dark, rich, and well-decomposed compost. In the foreground, several concrete blocks are visible, likely used to support the bin. The text "25 days later" is overlaid in yellow in the center of the image. The background shows a wooden wall with metal brackets.

25 days later

25 days later

5 months later...

Tomato plants

Mowed leaves

Dahlias, etc.

Mulched leaves

Leaves
(before mower
mulching)

Grass

Now is a great time to compost!

Why bother to compost?

What to compost?

How to compost?

(I hope I've addressed these questions... at least a little bit???)
